

SPHERICALPLATE 5D®

Ecosystem for Regenerative Medicine

► Stem Cell Research

« This plate is a game changer. Everyone who needs a lot of clusters needs this plate! »

Prof. Dr. Dr. Maximilian Y. Emmert

Institute for Regenerative Medicine, IREM
University of Zurich

The Benefits

- uniformity - standardization of spheroid formation
- no surface attachment due to pre-applied coating
- scalability- production of high quantities of spheroids to do high throughput analysis/screening (e.g. Omics > Proteomics/Genomics/Metabolomics)
- compatibility with standard, existing imaging, and automatization technologies/ equipment/systems > especially centralized position of spheroid within microwell
- Long and short time culture possible to generate sufficient spheroids
- co-culture of different cell-types possible
- collection of secretome from the spheroids possible

Example of stem cells successfully cultivated in SP5D

- Human bone marrow-derived mesenchymal stromal cells
- Human adipose-derived mesenchymal stromal cells
- Human amniotic epithelial cells
